## Prof. Erik Demaine

## Paths in graphs

Consider a digraph $G=(V, E)$ with edge-weight function $w: E \rightarrow \mathbb{R}$. The weight of path $p=v_{1} \rightarrow$ $v_{2} \rightarrow \cdots \rightarrow v_{k}$ is defined to be

$$
w(p)=\sum_{i=1}^{k-1} w\left(v_{i}, v_{i+1}\right) .
$$

## Paths in graphs

Consider a digraph $G=(V, E)$ with edge-weight function $w: E \rightarrow \mathbb{R}$. The weight of path $p=v_{1} \rightarrow$ $v_{2} \rightarrow \cdots \rightarrow v_{k}$ is defined to be

$$
w(p)=\sum_{i=1}^{k-1} w\left(v_{i}, v_{i+1}\right) .
$$

## Example:

## Shortest paths

A shortest path from $u$ to $v$ is a path of minimum weight from $u$ to $v$. The shortestpath weight from $u$ to $v$ is defined as $\delta(u, v)=\min \{w(p): p$ is a path from $u$ to $v\}$.

Note: $\delta(u, v)=\infty$ if no path from $u$ to $v$ exists.

## Optimal substructure

## Theorem. A subpath of a shortest path is a shortest path.

## Optimal substructure

Theorem. A subpath of a shortest path is a shortest path.

Proof. Cut and paste:

## Optimal substructure

Theorem. A subpath of a shortest path is a shortest path.

Proof. Cut and paste:

## Triangle inequality

Theorem. For all $u, v, x \in V$, we have

$$
\delta(u, v) \leq \delta(u, x)+\delta(x, v) .
$$

## Triangle inequality

Theorem. For all $u, v, x \in V$, we have

$$
\delta(u, v) \leq \delta(u, x)+\delta(x, v) .
$$

Proof.

$\square$

## ALGORITHMS <br> Well-definedness of shortest paths

If a graph $G$ contains a negative-weight cycle, then some shortest paths may not exist.

## ALGORITHM <br> $\square$ <br> Well-definedness of shortest paths

If a graph $G$ contains a negative-weight cycle, then some shortest paths may not exist.

## Example:

## Single-source shortest paths

Problem. From a given source vertex $s \in V$, find the shortest-path weights $\delta(s, v)$ for all $v \in V$.
If all edge weights $w(u, v)$ are nonnegative, all shortest-path weights must exist.
Idea: Greedy.

1. Maintain a set $S$ of vertices whose shortestpath distances from $s$ are known.
2. At each step add to $S$ the vertex $v \in V-S$ whose distance estimate from $s$ is minimal.
3. Update the distance estimates of vertices adjacent to $v$.

## Dijkstra's algorithm

$d[s] \leftarrow 0$
for each $v \in V-\{s\}$
do $d[v] \leftarrow \infty$
$S \leftarrow \varnothing$
$Q \leftarrow V \quad \triangleright Q$ is a priority queue maintaining $V-S$

## Dijkstra's algorithm

$d[s] \leftarrow 0$
for each $v \in V-\{s\}$
do $d[\nu] \leftarrow \infty$
$S \leftarrow \varnothing$
$Q \leftarrow V \quad \triangleright Q$ is a priority queue maintaining $V-S$
while $Q \neq \varnothing$

## Dijkstra's algorithm

$d[s] \leftarrow 0$
for each $v \in V-\{s\}$
do $d[\nu] \leftarrow \infty$
$S \leftarrow \varnothing$
$Q \leftarrow V \quad \triangleright Q$ is a priority queue maintaining $V-S$
while $Q \neq \varnothing$
do $u \leftarrow \operatorname{Extract-Min}(Q)$ $S \leftarrow S \cup\{u\} \quad$ if d $[u]=$ infinity: break; NOTE: all remain for each $v \in \operatorname{Adj}[u]$ (with v from Q) accessible from do if $d[v]>d[u]+w(u, v)$

## ALGORITHMS <br> Example of Dijkstra's algorithm

## Graph with nonnegative edge weights:

## Correctness - Part I

Lemma. Initializing $d[s] \leftarrow 0$ and $d[\nu] \leftarrow \infty$ for all $v \in V-\{s\}$ establishes $d[v] \geq \delta(s, v)$ for all $v \in V$, and this invariant is maintained over any sequence of relaxation steps.

## Correctness - Part I

Lemma. Initializing $d[s] \leftarrow 0$ and $d[v] \leftarrow \infty$ for all $v \in V-\{s\}$ establishes $d[v] \geq \delta(s, v)$ for all $v \in V$, and this invariant is maintained over any sequence of relaxation steps.
Proof. Suppose not. Let $v$ be the first vertex for which $d[v]<\delta(s, v)$, and let $u$ be the vertex that caused $d[v]$ to change: $d[v]=d[u]+w(u, v)$. Then,

$$
d[v]<\delta(s, v) \quad \text { supposition }
$$

$\leq \delta(s, u)+\delta(u, v) \quad$ triangle inequality $\leq \delta(s, u)+w(u, v) \quad$ sh. path $\leq$ specific path $\leq d[u]+w(u, v) \quad v$ is first violation
Contradiction.

## Correctness - Part II

Lemma. Let $u$ be $v$ 's predecessor on a shortest path from $s$ to $v$. Then, if $d[u]=\delta(s, u)$ and edge $(u, v)$ is relaxed, we have $d[v]=\delta(s, v)$ after the relaxation.

## Correctness - Part II

Lemma. Let $u$ be $v$ 's predecessor on a shortest path from $s$ to $v$. Then, if $d[u]=\delta(s, u)$ and edge $(u, v)$ is relaxed, we have $d[v]=\delta(s, v)$ after the relaxation.

Proof. Observe that $\delta(s, v)=\delta(s, u)+w(u, v)$. Suppose that $d[v]>\delta(s, v)$ before the relaxation. (Otherwise, we're done.) Then, the test $d[v]>$ $d[u]+w(u, v)$ succeeds, because $d[v]>\delta(s, v)=$ $\delta(s, u)+w(u, v)=d[u]+w(u, v)$, and the algorithm sets $d[v]=d[u]+w(u, v)=\delta(s, v)$.

## Correctness - Part III

## Theorem. Dijkstra's algorithm terminates with $d[v]=\delta(s, v)$ for all $v \in V$.

## Correctness - Part III

Theorem. Dijkstra's algorithm terminates with $d[v]=\delta(s, v)$ for all $v \in V$.
Proof. It suffices to show that $d[v]=\delta(s, v)$ for every $v \in V$ when $v$ is added to $S$. Suppose $u$ is the first vertex added to $S$ for which $d[u]>\delta(s, u)$. Let $y$ be the first vertex in $V-S$ along a shortest path from $s$ to $u$, and let $x$ be its predecessor:
$S$, just before adding $u$.

## Correctness - Part III (continued)

Since $u$ is the first vertex violating the claimed invariant, we have $d[x]=\delta(s, x)$. When $x$ was added to $S$, the edge $(x, y)$ was relaxed, which implies that $d[y]=\delta(s, y) \leq \delta(s, u)<d[u]$. But, $d[u] \leq d[y]$ by our choice of $u$. Contradiction. $\square$

## Analysis of Dijkstra

```
while \(Q \neq \varnothing\)
    do \(u \leftarrow\) Extract- \(\operatorname{Min}(Q)\)
        \(S \leftarrow S \cup\{u\}\)
        for each \(v \in \operatorname{Adj}[u]\)
        do if \(d[v]>d[u]+w(u, v)\)
            then \(d[v] \leftarrow d[u]+w(u, v)\)
```

## Analysis of Dijkstra

```
while \(Q \neq \varnothing\)
    do \(u \leftarrow\) Extract- \(\operatorname{Min}(Q)\)
        \(S \leftarrow S \cup\{u\}\)
        for each \(v \in \operatorname{Adj}[u]\)
        do if \(d[v]>d[u]+w(u, v)\)
            then \(d[v] \leftarrow d[u]+w(u, v)\)
```

## Analysis of Dijkstra

Can Dijkstra's algorithm be improved?

- Use a simple FIFO queue instead of a priority queue.
Breadth-first search
while $Q \neq \varnothing$ do $u \leftarrow \operatorname{Dequeue}(Q)$ for each $v \in \operatorname{Adj}[u]$ do if $d[\nu]=\infty$
then $d[\nu] \leftarrow d[u]+1$ Enqueue $(Q, v)$

## Unweighted graphs

Suppose that $w(u, v)=1$ for all $(u, v) \in E$.
Can Dijkstra's algorithm be improved?

- Use a simple FIFO queue instead of a priority queue.
Breadth-first search

$$
\begin{aligned}
& \text { while } Q \neq \varnothing \\
& \text { do } u \leftarrow \operatorname{Dequeve}(Q) \\
& \text { for each } v \in \operatorname{Adj}[u] \\
& \text { do if } d[v]=\infty
\end{aligned}
$$

$$
\text { then } d[\nu] \leftarrow d[u]+1
$$

$$
\text { Enqueue }(Q, v)
$$

Analysis: Time $=O(V+E)$.

## Correctness of BFS

$$
\begin{aligned}
& \text { while } Q \neq \varnothing \\
& \qquad \begin{array}{r}
\text { do } u \leftarrow \operatorname{Dequeve}(Q) \\
\text { for each } v \in A d j[u] \\
\text { do if } d[v]=\infty \\
\text { then } d[v] \leftarrow d[u]+1 \\
\\
\quad \operatorname{ENQUEUE}(Q, v)
\end{array}
\end{aligned}
$$

Key idea:
The FIFO $Q$ in breadth-first search mimics the priority queue $Q$ in Dijkstra.

- Invariant: $v$ comes after $u$ in $Q$ implies that $d[v]=d[u]$ or $d[v]=d[u]+1$.
